Written Assignment 3

Subject: Core English 3A

Lecturer: **Chhay Kossapol (CKP)**

Name: **Leang Cheasinh**

Class: E3.2

Academic Year

2025 - 2026

Writing Assignment #3

In this assignment, you are going to summarize, report the main features, and make comparisons of data within a diagram. To successfully complete this project, think of the lessons you have learnt in unit 3, namely vocabulary, the readings, grammar, and writing skills.

In this essay, you will write:

- Introduction
 - tells what the diagram shows
 - write an overview showing the number of stages and the start and end.
- Body Paragraph (two or three paragraphs)
 - Describe the process

Task 1: Read and check the model essay (1)

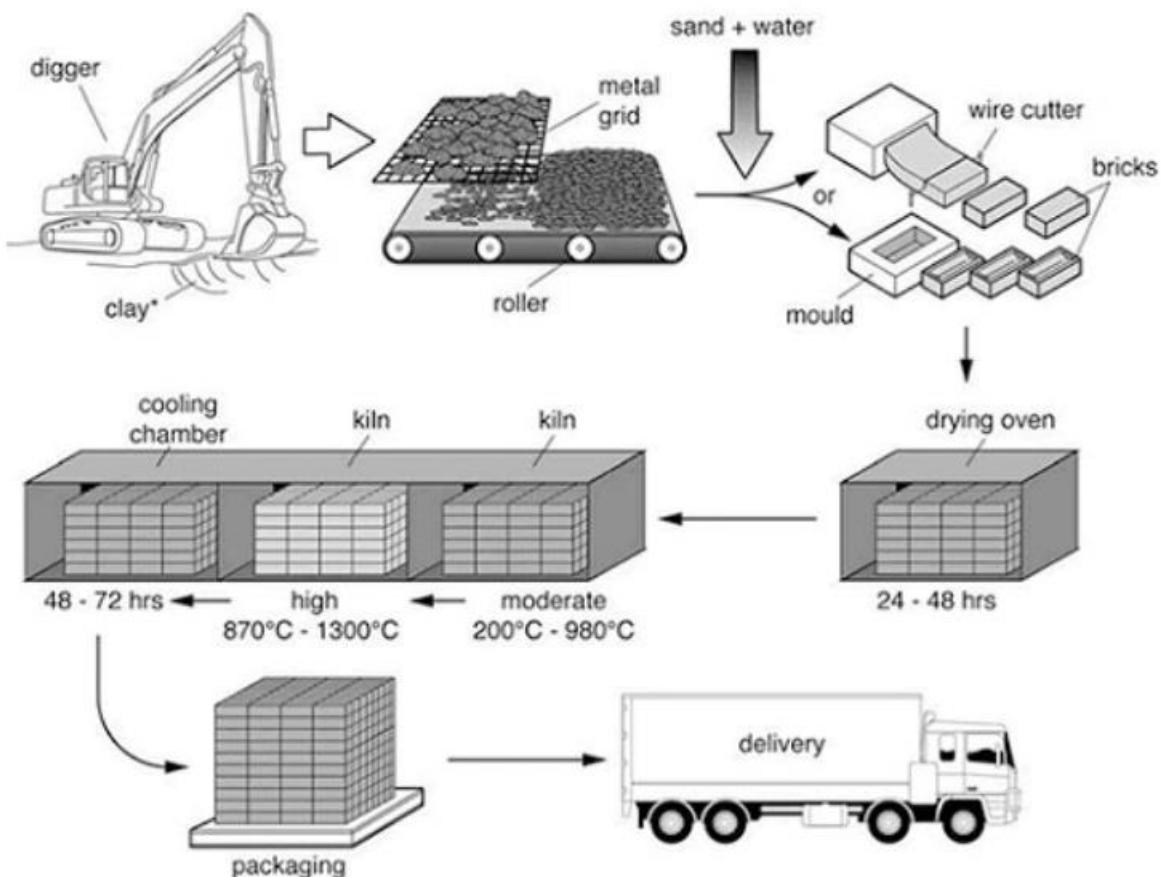

You should spend about 20 minutes on this task.

The diagram illustrates the process that is used to manufacture bricks for the building industry.

Summarise the information by selecting and reporting the main features and make comparisons where relevant.

Write at least 150 words.

The Brick Manufacturing Process

The diagram explains the way in which bricks are made for the building industry. Overall, there are seven stages in the process, beginning with the digging up of clay and culminating in delivery.

To begin, the clay used to make the bricks is dug up from the ground by a large digger. This clay is then placed onto a metal grid, which is used to break up the clay into smaller pieces. A roller assists in this process.

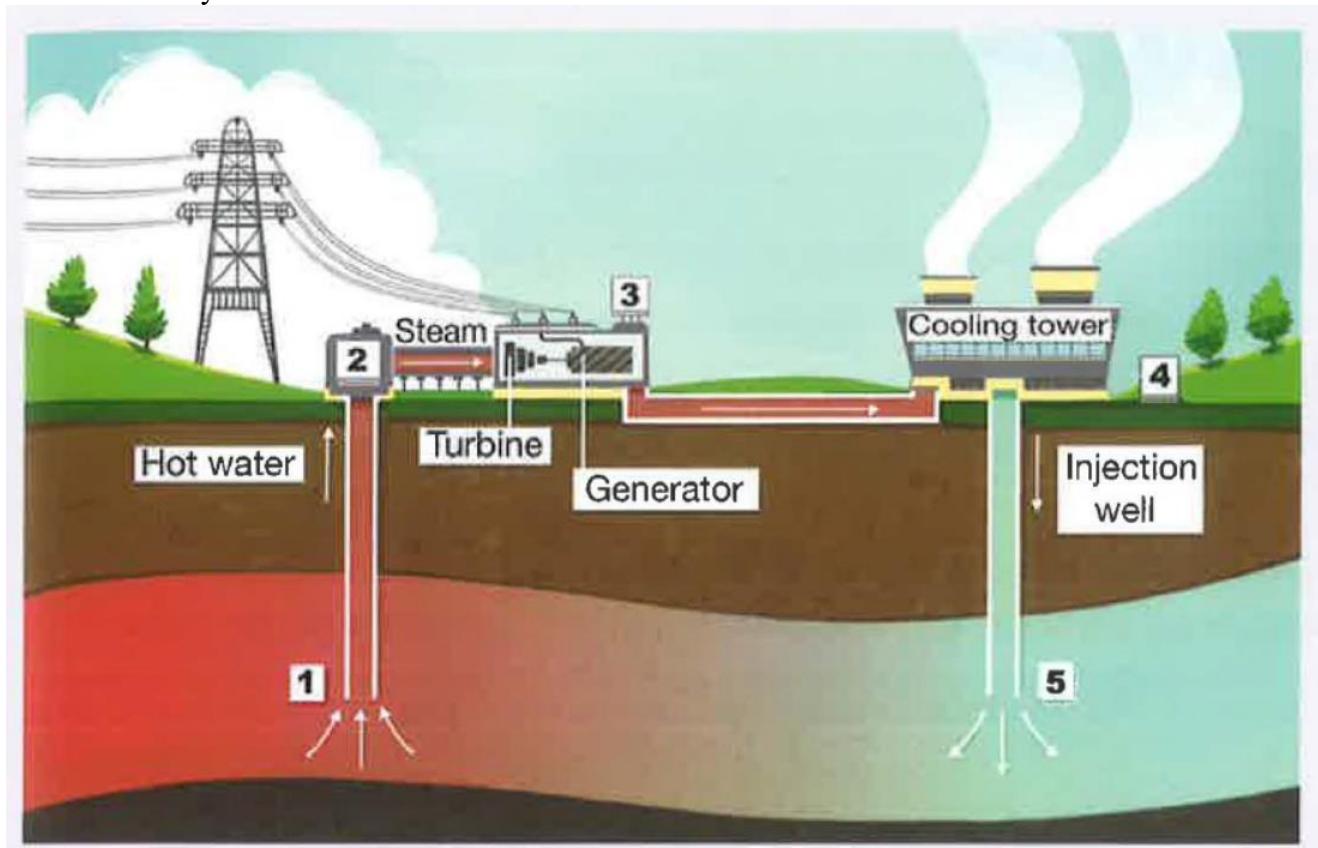

Following this, sand and water are added to the clay, and this mixture is turned into bricks by either placing it into a mould or using a wire cutter. Next, these bricks are placed in an oven to dry for 24 – 48 hours.

In the subsequent stage, the bricks go through a heating and cooling process. They are heated in a kiln at a moderate and then a high temperature (ranging from 200c to 1300c), followed by a cooling process in a chamber for 2 – 3 days. Finally, the bricks are packed and delivered to their destinations.

Task 2: Write an essay to describe the diagram below. Make sure to address all the questions.

The diagram illustrates how hydroelectric energy is produced.

Summarize the information by selecting and reporting the main features, and make comparisons where necessary.

Start Your Writing Below:

The diagram illustrates how geothermal energy is produced by using heat from beneath the Earth's surface to generate electricity.

Overall, the process consists of five main stages, beginning with the extraction of hot water from deep underground and ending with the reinjection of cooled water back into the Earth after electricity has been generated.

In the first stage, cold water is pumped deep below the ground through an injection well. As it travels downward, it passes through hot rocks and becomes heated. This hot water then rises back to the surface through a production well due to the pressure and high temperature underground.

Next, the hot water is directed to a turbine, where it produces steam. The force of the steam causes the turbine to spin, which in turn activates a generator. As the generator rotates, electrical energy is produced and transmitted through power lines for public use.

In the final stage, the steam is sent to a cooling tower, where it cools down and condenses back into water. This cooled water is then returned underground via the injection well, allowing the cycle to repeat continuously.
